

Microsoft introduced Windows 11 with Android apps Support.

## Description

After weeks of leaked news and teasers, Windows 11 has been announced. In Windows 11, Microsoft has made many important changes in every way. In terms of design, Microsoft has moved the start button from the bottom left to the middle. With this one change, Windows 11 looks like Mac OS and Chrome OS. Microsoft has introduced the Start menu. Has also changed its style.

The tiles design that came with Windows 8 has been scrapped in Windows 11. Users will now see the search bar at the top of the Start menu, and below it will be icons for users' pinned apps, as well as links to suggested files.

It will also be the same on all user devices such as phones and other computers.

The start menu in Windows 11 is similar to the app launcher used in mobile. The Snap Layouts feature offered in Windows 11 allows users to better customize the Windows interface and select custom layouts from existing layouts.

Microsoft has also made some changes to the Windows Store that will be available in Windows 10 and Windows 11.

Now users can also install apps from the browser. For this, the browser will allow users who work as a mini version store to quickly install apps. Microsoft wants to increase the opportunities for developers to make money from their stores. Microsoft says it is allowing developers to add their own commerce to the store and keep 100% of their revenue to themselves.

Microsoft will not keep anything from this revenue. In addition, developers can use Microsoft Commerce if they wish, with 85% of revenue coming from developers and 15% from Microsoft. A revolutionary change to Microsoft's Windows 11 is the addition of support for Android apps. You will now be able to install Android apps on your computer from the Microsoft Store.

That means users don't have to use other heavy-duty third-party software to run Android apps on a computer. Support for Android apps in Windows is the result of a partnership with Intel. The main purpose of Intel Bridge technology is to enable Android apps to run on x86 devices. According to a statement, despite the partnership with Intel, this feature will work on AMD and ARM devices. Also work on devices.

Windows 11 is faster than previous versions. Windows Updates will now be 40% smaller in size and install faster. Microsoft claims that Windows 11 will also improve laptop battery timing.
